CHÂTEAU BLANC

QUARTZITE

BRAZIL

CHÂTEAU BLANC

Description

Château Blanc is a white quartzite extracted from the north-eastern region of Brazil. This stone travels over 1200 miles in difficult conditions through breathtaking landscapes before arriving at the point where it is transformed, Château Blanc features an appealing combination of goldens and creams. Its crystalline white background is interspersed with rust-colored veining.

In the course of the polishing process, an epoxy resin is applied to the stone's surface to fill part of its porosity (or pores) and natural cracks that may be apparent. This has no incident on the durability, the maintenance or the beauty of the natural stone. It is possible that certain pores are too small to contain efficiently the resin, and reopen during the finishing stages. However, this does not affect the stone's quality or beauty. Such as it is the case with many natural stones, it is recommended to apply a sealer to extend its beauty through time.
